

Darvin Raj P

Analytics Engineer / Data Analyst with 5 years of experience with blockchain data. I fully owned the data pipelines powering Swell Network’s points and airdrop distribution, portfolio page, vault, and competitor monitoring systems. I suggested data-backed decisions that drove \$500M inflows to our PreDeposit vault and safeguarded \$5M in assets from an integration that executed a liquidity pull. No matter the complexity of data, not only can I decipher it, conform it to a standardized schema, and account for every last share, but I can also build an end-to-end system serving the requirements. Currently building an auditable data pipeline of Polymarket activity to power my Insider Trading research.

PROJECT

Polymarket Onchain Ledger & PnL Reconstruction

April 2026 - Present

- Built an auditable event-level ledger from raw onchain data to reconstruct wallet-market positions, USD flows, and PnL without relying on Polymarket’s API.
- Defined data-quality invariants including non-negative running balances and complete USD accounting, then reconciled results against ERC-1155 balances and sampled API positions.
- Built a 6-signal insider-trading detection framework across ~18M trades covering 7 months

EXPERIENCE

Swell Network, Full-time - Remote (Sydney Time)

April 2024 - February 2026

- Architected ClickHouse data models, materialized views, and Python pipelines ingesting data from 150+ DeFi integrations.
- Rebuilt 2 years of integration data in 2 months, replacing an existing points-tracking system and fast-tracking airdrop execution.
- Developed clustering and community detection workflows to detect exploitative user behavior
- Partnered with Operations and Marketing, supporting them with on-demand analytics
- Acted as Technical Liaison for Swellchain deployment, and led data and infra partnerships

PYOR, Full-time - Remote (Bengaluru)

October 2022 - October 2024

- Led a 6-member analyst team and designed cohort and control analysis frameworks to evaluate Arbitrum DAO grant expenditure - \$150K in ARB grants.
- On a 3-member analyst team, I owned onchain research and built DBT DAGs converting raw data into standardized KPIs - \$130K in ARR.
- Built Dune dashboards covering DEX, lending, liquid restaking, and RWA ecosystems.
- Developed completeness and correctness check workflows for datasets scaling to terabytes.

Flipside CEA, Freelance -Remote (US)

August 2021 - September 2022

- Built the Anchor Protocol Risk Monitoring dashboard, which detected unsustainable borrow concentrations supporting lending returns.
- Automated the RociFi Credit Risk Reporting to daily updates on borrower and system health

SKILLS

Analytics Engineering:
SQL, DBT, Data modeling, Schema design, ELT pipelines, Metric design, Data Quality, Accounting, Event processing, Blockchain Indexing

Data Platforms:
ClickHouse, Trino, Snowflake, Dune, DuckDB, BigQuery

Programming:
Python, Pandas, Polars, NumPy, Numba, TypeScript

Visualization:
Matplotlib, D3.js, Plotly, Looker, Superset

Other: Git, Linux, FastAPI, Litestar, Astro

EDUCATION

Christ University, Bengaluru
MSc Physics - 8.52 CGPA
April 2019 - April 2021
BSc Physics - 8.92 CGPA
April 2016 - April 2019

LANGUAGES

English - native
Tamil - native
Spanish - elementary
Mandarin - beginner
